1: Corridor Overview

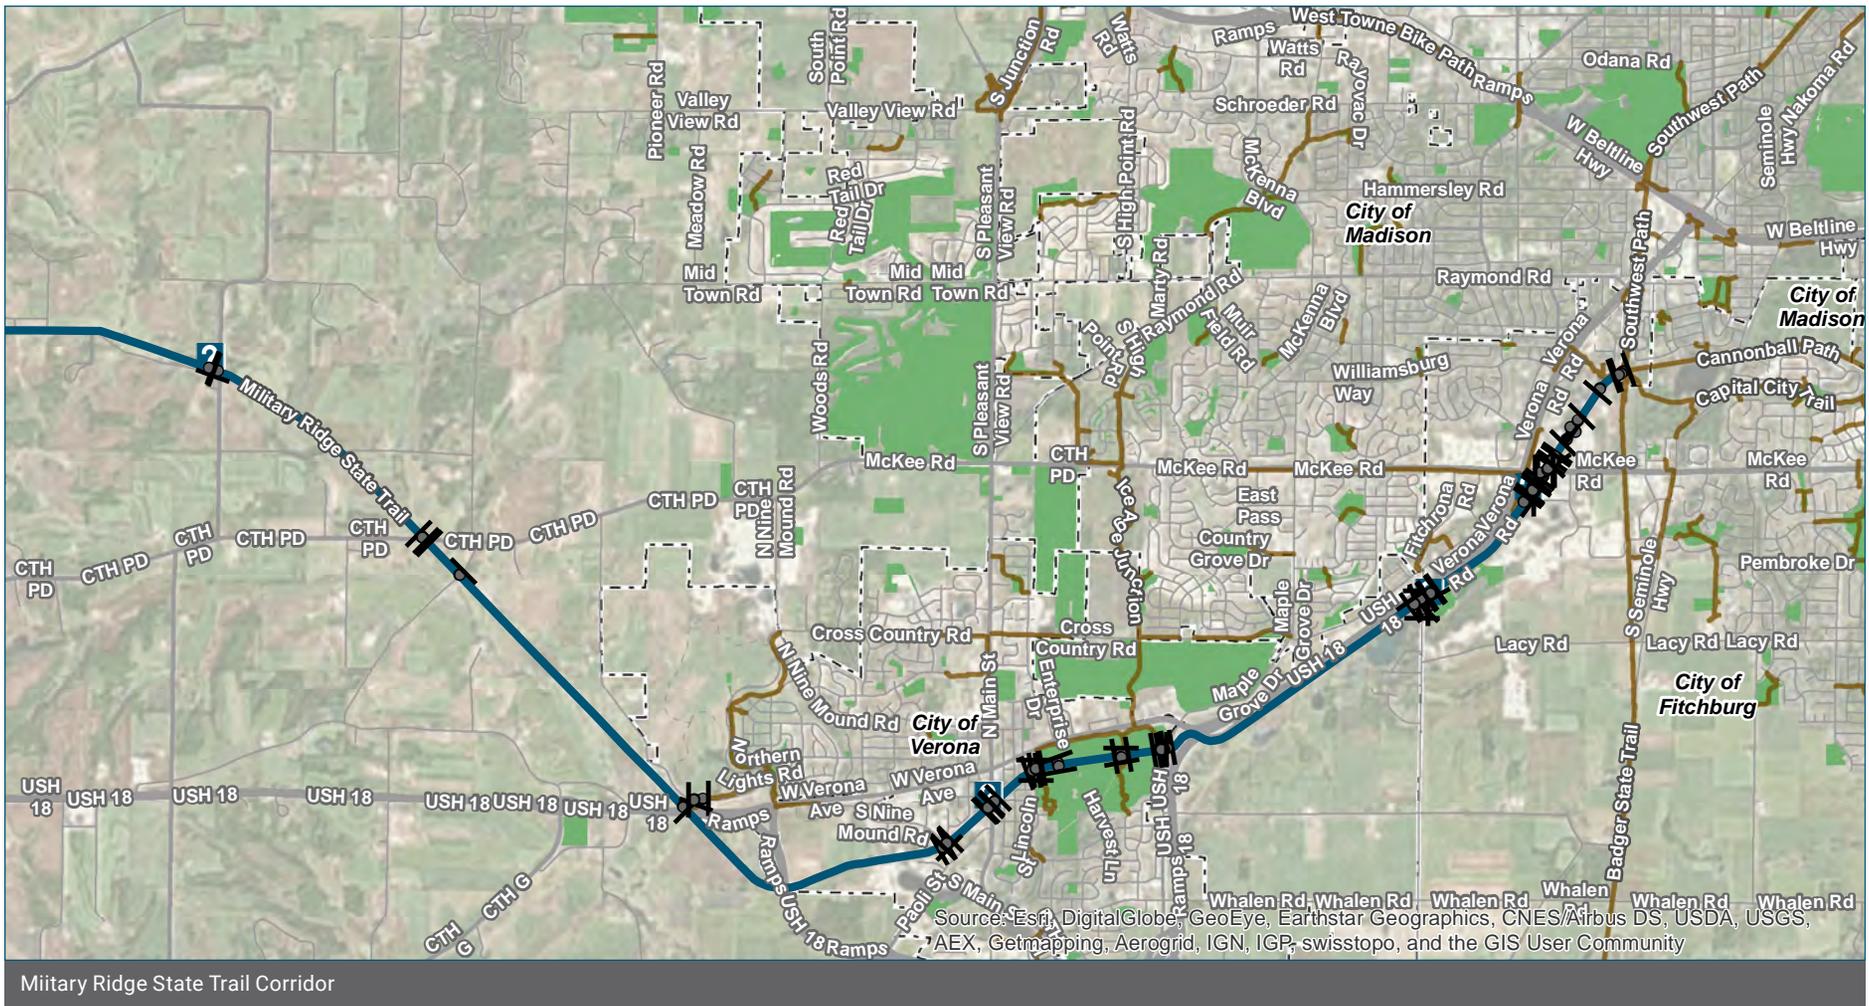

Corridor Overview

The 40-mile Military Ridge State Trail connects Madison to Dodgeville along the former Chicago and North Western Railroad corridor, which has a gentle grade of only 2 to 5 percent.

The portion of the trail included in this wayfinding plan starts at the Bicycle Roundabout, passes through downtown Verona and Mount Horeb, and ends at the spur path to Blue Mound State Park

West of Verona, the trail is a crushed limestone surface that traverses some of Dane County's most picturesque landscapes: woods, wetlands, farms, and prairie.

How to Use this Wayfinding Sign Plan

This wayfinding sign plan was developed using the methodology and guidelines in the Dane County Bicycle Wayfinding Manual (“the Manual”). The Manual informed decisions about where to place sign assemblies and the destinations to include on signs. The Manual also provides detailed standards for sign design, fabrication, and installation.

This plan includes the following sections to help field crews with sign placement and installation:

Post Installation

Provides specifications on sign mounting standards and the proper hardware to be used. Some jurisdictions may have their own sign mounting standards that should be followed instead.

Corridor overview maps

Show the approximate locations of the sign assemblies along the entire Cannonball Path corridor. Sign assemblies are labeled by their Assembly ID number

Sign Assembly Detail Sheet

Each Sign Assembly Detail Sheet displays the Assembly Identification code at the top, an image of the sign assembly as it should look mounted to the post, a map of the assembly location, and placement information. Most Detail Sheets also include a photo of the approximate location to aid in placement.

Judgement Required

This sign plan does not provide full engineering documents for each sign placement and installation. The sign placement locations in this guide were made using a combination of aerial satellite images, Google Street View, and field work. Therefore, the locations for each sign assembly are rough estimates.

For each sign assembly, the Sign Assembly Detail Sheet provides approximate distances for the sign assembly placement from both the nearest intersection and from the road or path on which the sign assembly is installed. The distances provided on the Sign Assembly Detail Sheet may point to a deep ditch, a location that blocks another sign, or a location that is blocked from view by overhanging branches. The field crew manager will need to use judgement to install the signs in a location where they are visible from the road or path.

Common Terms Used in this Plan

Sign Assembly

A combination of one or more sign panels mounted to the same post and facing the same direction.

Sign Placement

The approximate location, on a path or street, where the sign assembly should be installed

Sign Panel

One single sign plate. Most of the wayfinding sign assemblies in this guide have two or more sign panels.

Post Installation

The specific distance from the street, sidewalk or path that the post should be embedded, and the height of the post that should be used.

Sign Mounting

The height and direction, and sign panel assembly order as mounted to the post

How to Read the Sign Assembly Detail Sheets

The Sign Assembly Detail sheets are displayed in this plan in order of east to west, from the Bicycle Roundabout to Blue Mound State Park. The Sign Assembly ID numbers do not have a particular order. They are only to be used to match the sign assembly on the plan maps, to the Assembly ID in the Detail Sheets.

- Maps in this Sign Plan display the approximate location of each sign assembly, the sign assembly ID number, and the orientation of the sign panel.
- The assembly symbols are rotated to show the direction the sign assembly is to face. The “post” symbol is shown behind the “panel” symbol.

2: Fabrication and Installation Details

Fabrication and Installation Details

Fabrication Specifications

Signs shall be installed in accordance with each governing jurisdiction's standards and specification. For jurisdictions that don't have their own standard sign fabrication specifications, the Wisconsin Department of Transportation's (WisDOT) Standard Specifications for Signs may be used. They may be found at <http://wisconsindot.gov/Pages/doing-bus/eng-consultants/cnslt-rsrcs/rdwy/stnds-spec.aspx>, under Part 6 – Incidental Construction, Section 637 Signing.

Sign Dimensions

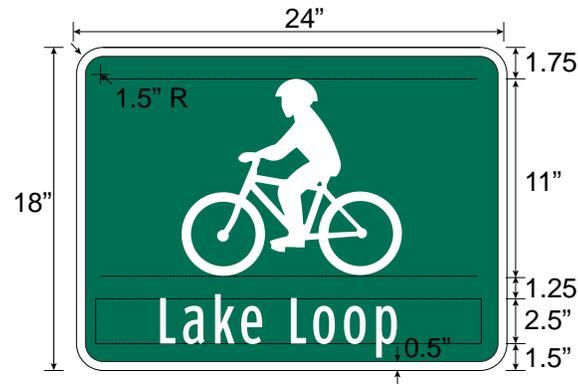

Identification/Shared-Use Paths (I-SP)

- 18" tall x 24" wide
- Highway Gothic font with at least 2" capital letter height; 2.5" height is preferred. Use upper and lower case for text
- Shared-Use Paths should be identified with bicycle and pedestrian symbols

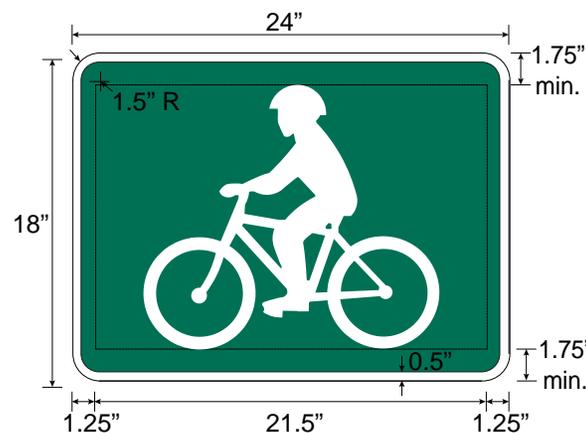

Identification/On-Street Routes (I-OS)

- 18" tall x 24" wide
- Bicycle rider symbol only
- For "signature" named on-street routes, include the name of the route below the bicycle symbol in Highway Gothic font with at least 2" capital letter height. 2.5" height is preferred. Use upper and lower case for text.

Identification/Path Access (I-PA)

- 18" tall x 24" wide
- Highway Gothic font with at least 2" capital letter height; 2.5" height is preferred.
- "TO" is upper case, path name is upper and lower case
- Shows bicycle and pedestrian mode symbols and the name of the path

Fingerboards

- 6", 9", or 12" tall x 24" wide
- Highway Gothic font with 2" capital letter height.
- Use upper and lower case for text
- Standard horizontal spacing between the main elements of a fingerboard (arrows, text, symbols, and distance) is one inch (1"); the recommended minimum spacing is 3/4".

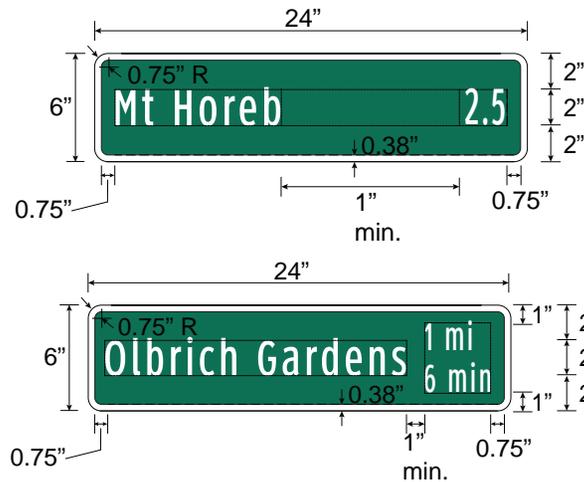

Fingerboard Arrow Panel (FB-A)

- Shows destination name and directional arrows
- Place left and through arrows on the far left of the sign; place right arrows on the far right

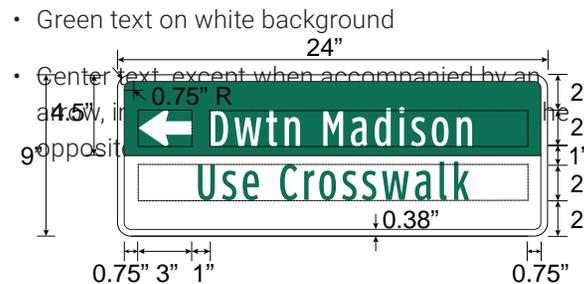

Fingerboard Distance Panel (FB-D)

- Shows destination name and distance (and optionally, time)

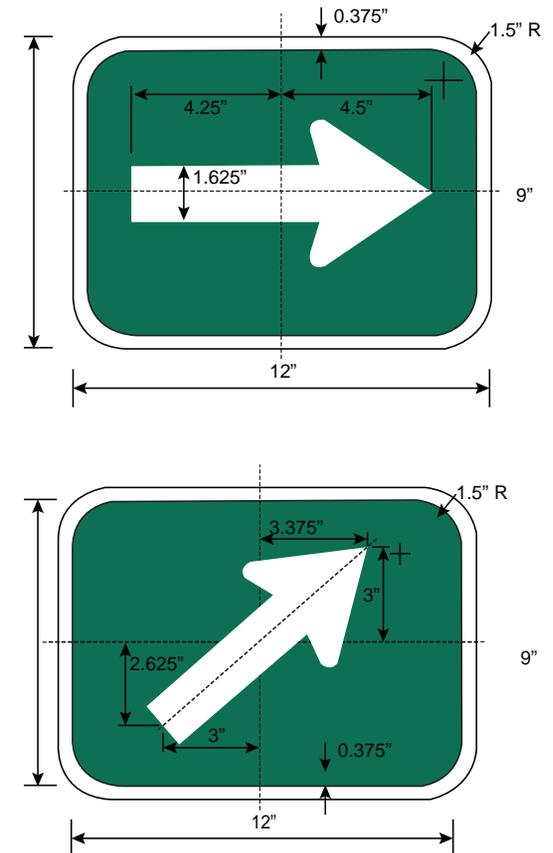

Fingerboard Navigation Aid Panel (FB-NA)

- Combines the FB-A or FB-D panels with supplementary information to help cyclists use preferred route

Arrow Plaques (AR)

- 9" tall x 12" wide
- Any of the standard MUTCD directional arrow plates may be used

Installation Details

Signs and sign posts shall be installed according to the governing jurisdiction's standards and specifications. For jurisdictions that don't have their own standards, the following may be used.

Post style

Sign posts should allow signs to be mounted on all four sides. The following post styles are acceptable:

- 2" square perforated galvanized post
- 2 3/8" round galvanized post
- 4" square wood post (for parks and natural settings)

The length of the post and the depth of the embedment will depend upon the overall weight of the signs and the soil/pavement conditions.

Roadway Installation

Posts of 12' in height can usually accommodate an identification panel with two fingerboard panels.

Wayfinding assemblies should be installed on separate posts from existing signs, except where they do not conflict with the existing sign.

- Wayfinding assemblies may be placed above parking restriction signs.
- Wayfinding assemblies may be placed below Bike Lane signs.
- The post may need to be replaced with a longer post to maintain the 7' minimum vertical clearance.

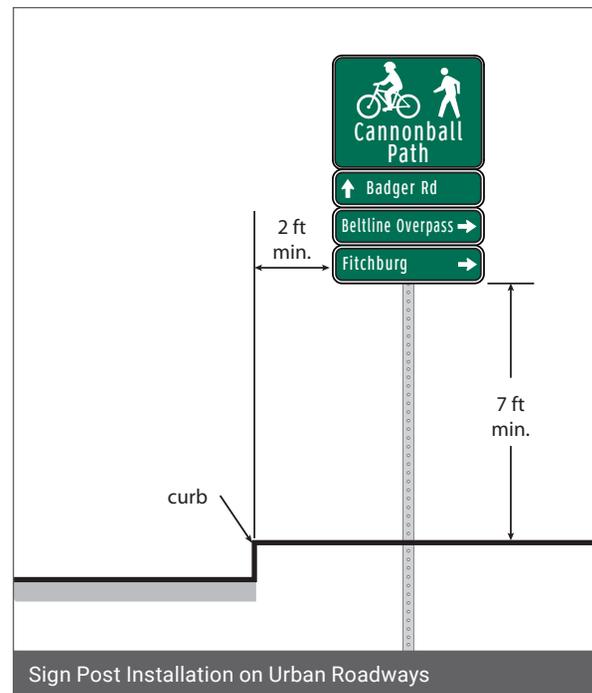

Urban Roadways

Vertical Clearance

- Minimum of 7 feet from the ground to the bottom edge of the sign.

Lateral Clearance

- Minimum of 2 feet from face of the curb to the side edge of the sign (post should be installed at least 3 feet from the face of the curb).
- In dense commercial areas where existing posts are close to the curb: 1 foot from face of curb to edge of sign (post should be in-stalled at least 2 feet from face of curb).
- Signs should not intrude into a sidewalk.

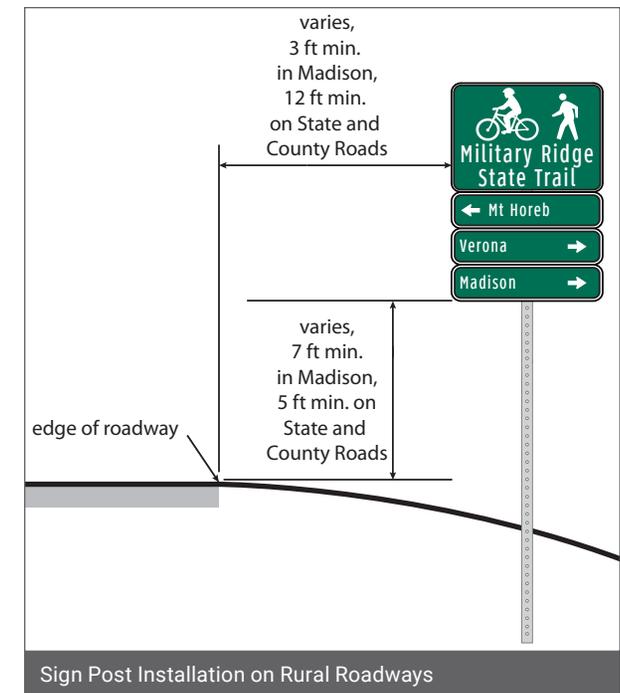

Rural Roadways

Vertical Clearance

- Municipal Streets: Refer to local jurisdiction standards.
- State and County Roads: Minimum of 5 feet from the pavement to the bottom edge of the sign.

Lateral Clearance

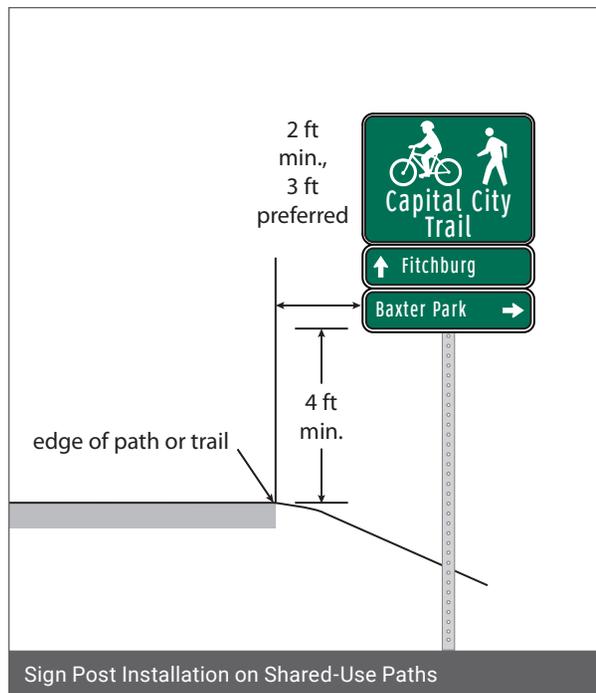

- Municipal Streets: Refer to local jurisdiction standards.
- State and County Roads: minimum of 12 feet from the edge of the travel lane to the edge of the sign.

Shared-Use Path Installation

Posts of 10' in height can usually accommodate an identification panel with two fingerboard panels. This height will allow for the installation of supplementary signs while maintaining a minimum 4' height as measured from the height of the shared use path to the bottom edge of the bottom sign.

It is common on shared-use paths for two sign assemblies to be mounted on the same sign post. If signs are mounted perpendicularly using standard bolts, longer posts may be required. Alternatively, jurisdictions may consider the use of wing brackets to allow two or more signs to be mounted perpendicularly at the same height.

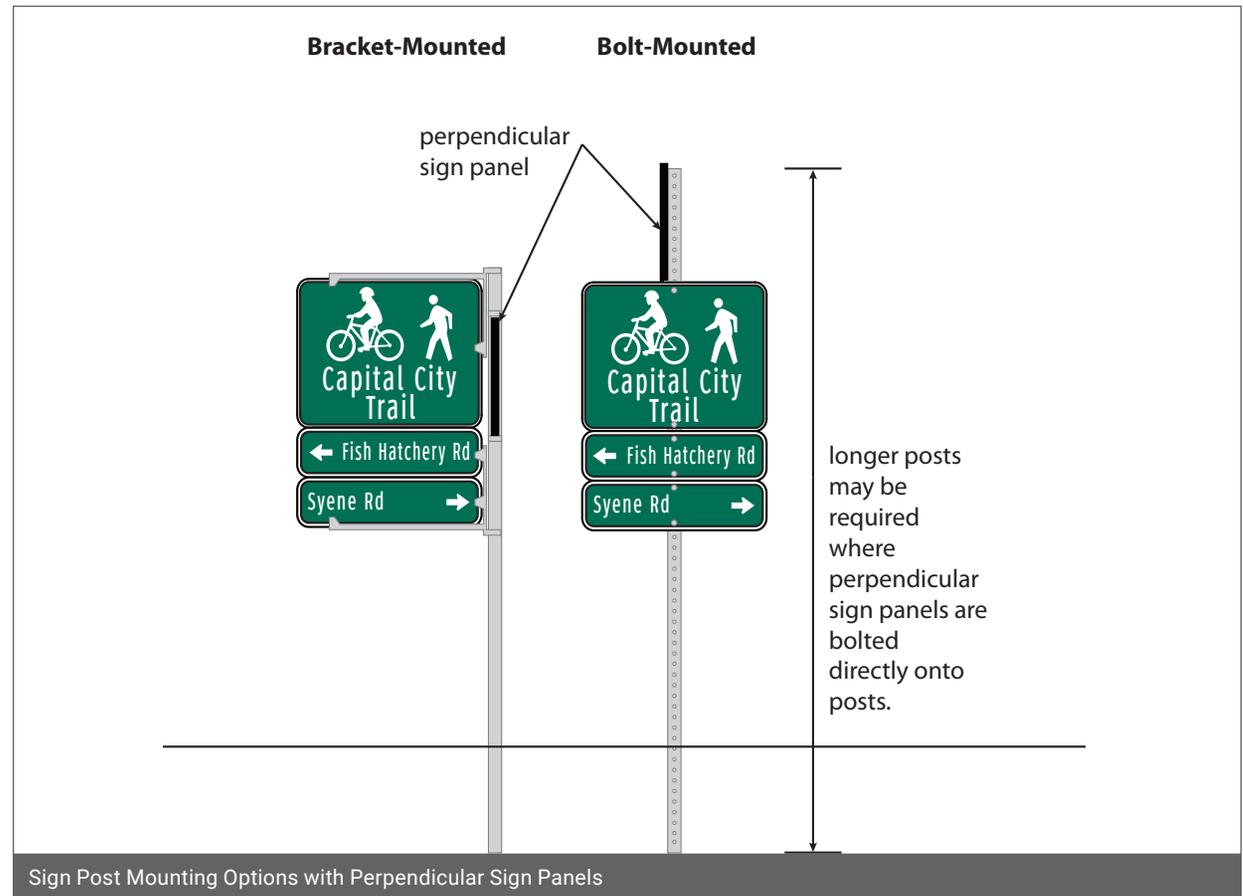

Shared Use Paths

Vertical Clearance

- Minimum of 4 feet from the height of the shared use path to the bottom edge of the sign.
- For signs placed overhead of shared-use paths, a minimum of 8 feet vertically over entire width of shared-use path.
- Mile Markers along shared-use paths should be installed so the bottom of the sign is 3 feet from the height of the shared-use path.

Lateral Clearance

- Preferred: 3 feet from the edge of the path to the side edge of the sign (post should be installed at least 4 feet from the edge of the path).
- Minimum: 2 feet from the pavement to the side edge of the sign (post should be installed at least 3 feet from the edge of the path).

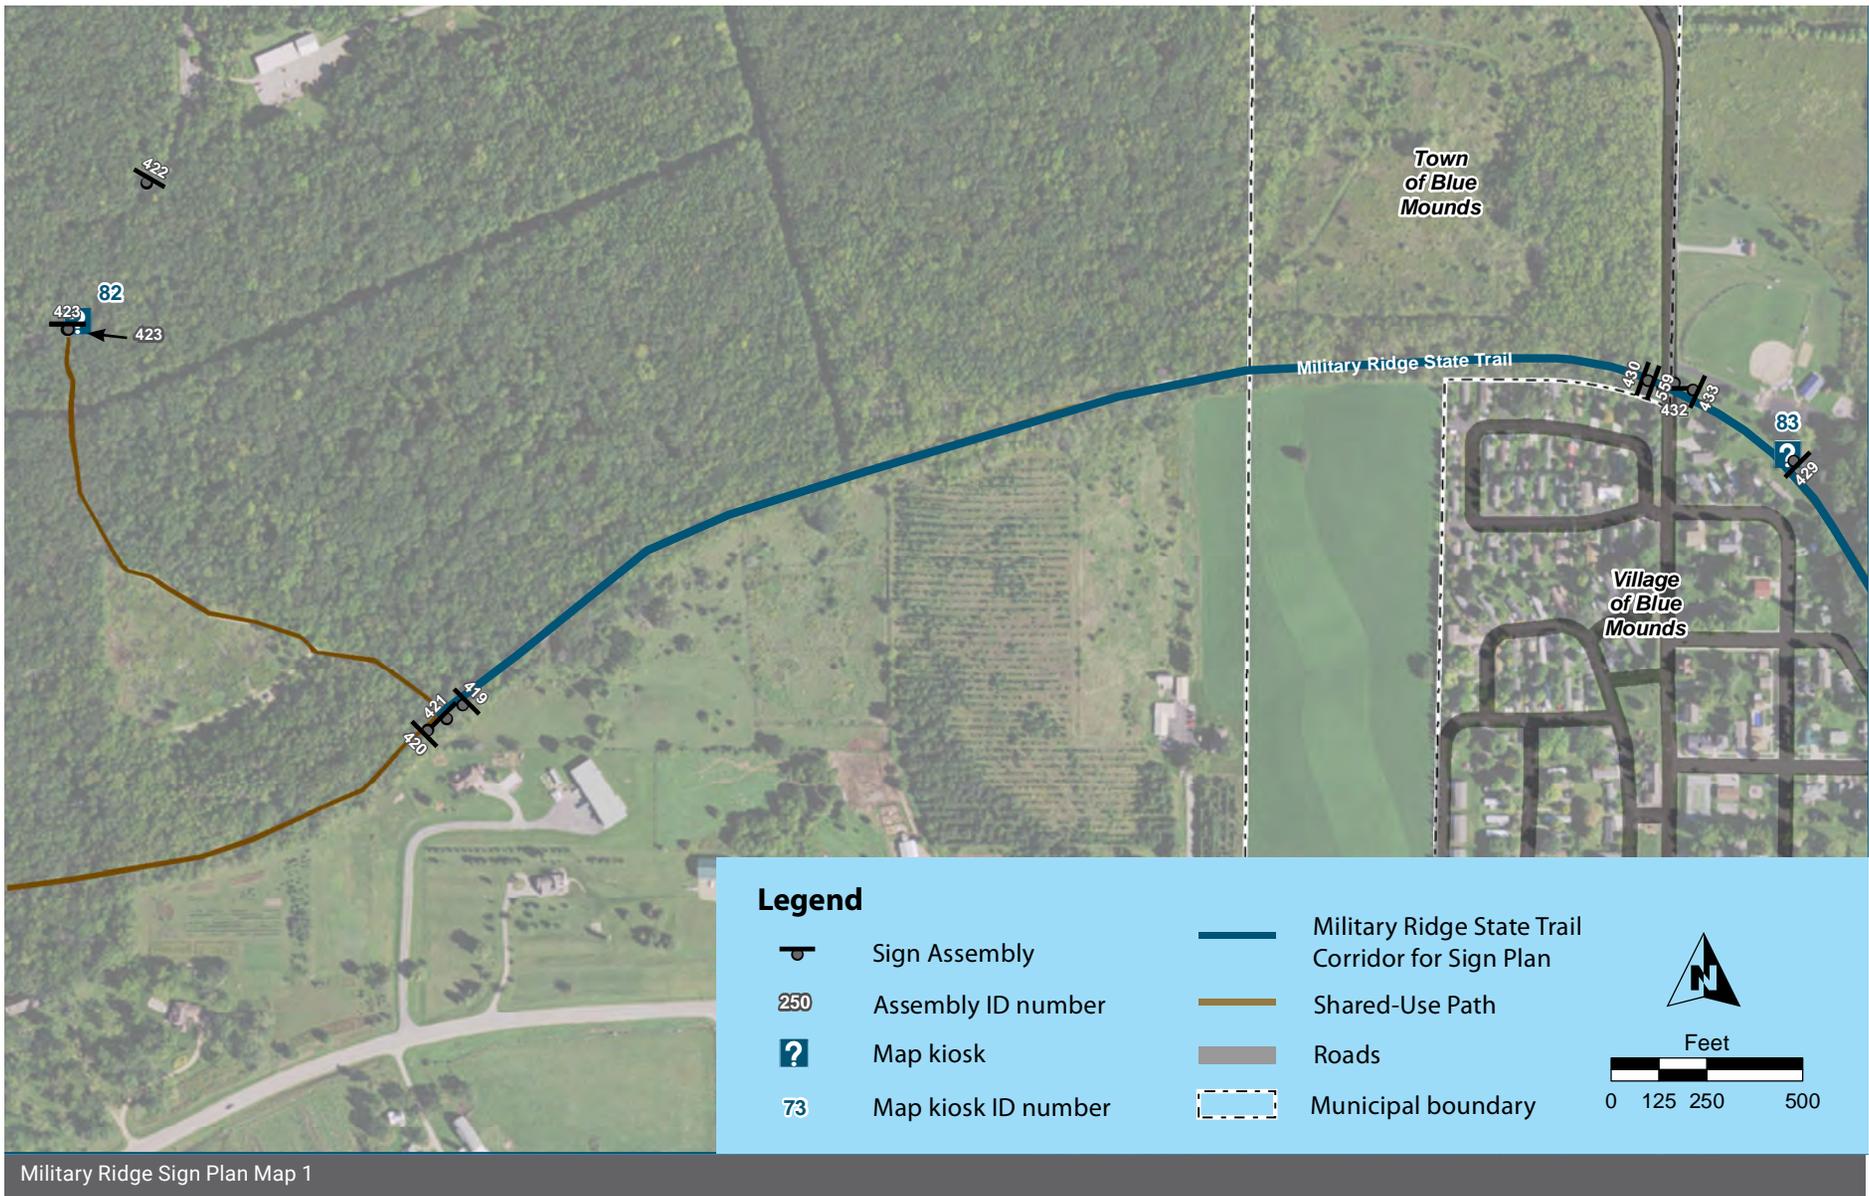

THIS PAGE INTENTIONALLY LEFT BLANK

3: Plan Maps

Plan Maps

The following 16 maps show the wayfinding sign plan for the corridor. The maps start at the western terminus of the corridor and end at the Bicycle Roundabout at the eastern terminus, and are not continuous; there are missing areas where no signs are needed. Sign Assemblies are labeled with their Assembly ID number. The symbols are rotated to show the direction the sign assembly should be facing, so that the “post” symbol is shown behind the sign “panel” symbol.
